## SECTION 3 CIRCUIT DESCRIPTION

### 3-1 VHF RECEIVER CIRCUITS

#### 3-1-1 ANTENNA SWITCHING CIRCUIT (HPF UNIT)

The received signals that pass through the LPF UNIT are separated as VHF and UHF signals on the HPF UNIT and are applied to each RF amplifier circuit.

The HPF UNIT contains a high-pass filter, low-pass filter and an antenna switching circuit. The VHF signals pass through the low-pass filter (L3~L5, C6~C10) and the antenna switching circuit (C12~C14, L6, L7, D2). The VHF signals are then applied to the V•RF UNIT. The high-pass filter (C1~C5, L1, L2) is designed for UHF receiving and does not allow VHF signal passage.

#### 3-1-2 RF AND 1ST MIXER CIRCUITS (V•RF UNIT)

The RF and 1st mixer circuits are located on the V•RF UNIT where the signals are amplified at Q1 and Q2 and are then converted to a 1st IF signal at Q3. The frequency of the 1st IF signal is 30.875 MHz.

Q3 converts the RF signal using the V•PLL output signal coming from the "LLO" line.

The VHF RF circuit adopts a tuned bandpass filter circuit that tunes the filters to the center frequency of the receiving signal using varactor diodes (D2, D4, D5). A PLL lock voltage is used for the filter tuned signal.

#### 3-1-3 IF CIRCUIT (DET UNIT)

The 1st IF signal passed through the crystal filter (F11 on the MAIN UNIT) enters the DET UNIT. The DET UNIT converts the 1st IF signal to a 2nd IF signal and then detects AF signals. The unit also has a squelch circuit that is explained in Section 3-1-5.

The 1st IF signal amplified at Q3 is applied to the FM IF IC (IC1, pin20). IC1 contains mixer, oscillator, limiter amplifier, quadrature detector and meter detector circuits.

IC1 converts the entered signal from pin 20 to a 455 kHz 2nd IF signal using the oscillated signal and outputs the 2nd IF from pin 4 to pass through the crystal filter (F11). The 2nd IF signal re-enters IC1 (pin8) where it is converted to an AF signal at a quadrature detector (IC1, X1). The AF signals are output from IC1 (pin11) and are de-emphasized with  $-6$  dB/oct. at the integrating circuit (R8, C28, C29) and are then applied to the AF UNIT.

#### 3-1-4 AF CIRCUIT (AF UNIT)

The AF UNIT contains the AF drive amplifier (Q1, Q2), power amplifier (IC1), noise squelch switch (Q4~Q6) and tone squelch switch (Q3).

The AF signals from the DET UNIT are amplified at the AF drive amplifier and are passed through the [VOL] control on the VR UNIT and are then amplified at the power amplifier (IC1) to obtain the speaker driving level.

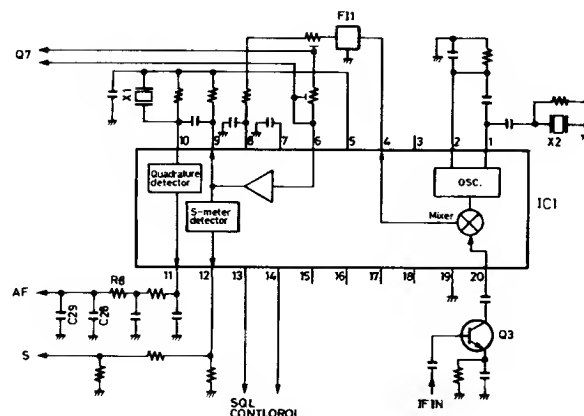

#### 3-1-5 SQUELCH CIRCUIT (DET AND AF UNITS)

In an FM receiver, noise signals are output from the speaker when no signal is received and are suppressed when a signal is received. The noise squelch circuit cuts off the noise signals using this phenomenon.

Noise components in AF signals (20 kHz and above) are amplified at the active filter (IC1, R10, R11, C14, C15 on the DET UNIT) and are rectified at D1 to convert to DC voltages. These voltages switch Q2. Thus, while receiving no signal, the "LOW" signal is output from the DET UNIT as the "BUSY" signal.

If the "BUSY" signal goes down, the "AFS" signal goes down. The "AFS" signal controls the power source (Q4~Q6) of the AF power amplifier (IC1). Thus, when the "BUSY" signal is at "LOW," the AF power amplifier does not operate.

When an optional tone squelch unit is installed, Q5 on the MAIN UNIT controls the "AFS" signal using the "TSQL" signal.

IF CIRCUIT

## 3-2 UHF RECEIVER CIRCUITS

### 3-2-1 ANTENNA SWITCHING CIRCUIT (U-SW UNIT)

The antenna switching circuit is mainly the same as the VHF band. Refer to Section 3-1-1 for details. The following parts are different from the VHF band:

The UHF signals pass through the high-pass filter (L1, L2, C1~C5 on the HPF UNIT) and the antenna switching circuit (L1, L2, C1~C3, D1 on the U-SW UNIT).

### 3-2-2 RF AND 1ST MIXER CIRCUITS (U-RF UNIT)

The RF and 1st mixer circuits are located on the U-RF UNIT where the signals are amplified at Q1 and Q2, and are then converted to a 1st IF signal at Q3. A frequency of the 1st IF signal is 30.875 MHz.

Q3 converts the RF signal using the U-PLL output coming from the "HLO" line.

The UHF RF circuit adopts a helical coil bandpass filter circuit (L1, L2) to suppress out-of-band signals.

### 3-2-3 IF, AF AND SQUELCH CIRCUITS

These are the same as the ones commonly used with the VHF receiver circuit. Refer to Section 3-1-3~3-1-5 for details.

## 3-3 VHF TRANSMITTER CIRCUITS

### 3-3-1 MIC AMP CIRCUIT (MIC UNIT)

The mic amplifier circuit amplifies audio signals with 6 dB/oct. pre-emphasis from the microphone to a level needed for the modulation circuit.

The MIC UNIT has a low level amplifier with pre-emphasis (IC3a) and a limiter amplifier (IC3b).

### 3-3-2 MODULATION CIRCUIT (V-PLL UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

The audio signal from the MIC UNIT (VMOD signal) changes the reactance of a varactor diode (D2) to modulate the oscillated signal at the TX VCO (Q5). The oscillated signal is buffer-amplified at Q6 and Q8, and is then applied to the drive amplifier circuit on the MAIN UNIT via the "VLO" line.

### 3-3-3 DRIVE AND POWER AMPLIFIER CIRCUITS (MAIN UNIT)

The drive amplifiers (Q8, Q9) and power amplifier (IC1) amplify the VCO oscillating signal to an output level. Collector currents of the drive amplifiers are controlled by the APC circuit (refer to Section 3-3-4 for details).

### 3-3-4 APC CIRCUIT (APC AND HPF UNITS)

The APC circuit selects high or low output power and protects the power amplifier from antenna mismatch impedance.

D1 on the LPF UNIT detects progressive wave and D3 on the HPF UNIT detects reflecting wave. When the antenna is matched at 50  $\Omega$ , the combined voltages of progressive and reflective detection (PDET voltages) are minimum values. The PDET signal is applied to the APC UNIT.

The APC UNIT contains the APC control circuit (Q2, Q4, Q6, Q7) and the UHF transmitter RF circuit (Q1, Q5). Q4 compares the PDET voltages and reference voltages. When the PDET voltages are higher than reference voltages, Q4 reduces collector currents of Q2 on the U-YGR UNIT. These currents are applied to the drive amplifiers (Q8, Q9 on the MAIN UNIT) via the "APD" line to reduce the RF output power.

HIGH or LOW output power is determined with the reference voltages of the APC circuit. IC1 (pins 6, 7) on the IO UNIT are used as the power selector ports and R4 and Q3 on the U-YGR UNIT are used as reference voltage adjustment.

APC CIRCUIT

### 3-4 UHF TRANSMITTER CIRCUITS

#### 3-4-1 MIC AMP CIRCUIT (MIC UNIT)

This is the same as the one commonly used with the VHF transmitter circuit. See Section 3-3-1 for details.

#### 3-4-2 MODULATION CIRCUIT (U-PLL UNIT)

The audio signal from the MIC UNIT (UMOD) changes the reactance of a diode(D3)to modulate the oscillated signal at the VCO (Q11). The oscillated signal is amplified at the buffer amplifiers (Q2, Q3 on the U-PLL UNIT and Q7 on the MAIN UNIT) and is then applied to the drive amplifier circuit on the APC UNIT.

### 3-4-3 DRIVE AND POWER AMPLIFIER CIRCUITS (APC AND U-YGR UNITS)

The drive amplifiers (Q1 on the APC UNIT and Q1 on the U-YGR UNIT) and power amplifier (IC1 on the U-YGR UNIT) amplify the VCO oscillating signal to an output level. Collector currents of the drive amplifiers are controlled by the APC circuit (refer to Section 3-3-4 for details).

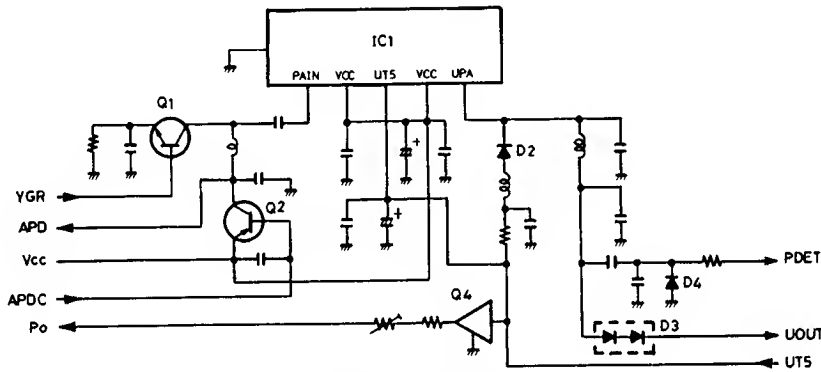

#### 3-4-4 APC CIRCUIT (APC AND HPF UNITS)

The APC circuit of the UHF band is mainly the same as the VHF band. Refer to Section 3-3-4 for details. The following parts are different from the VHF band:

Reflective detector : D4 on the U-YGR UNIT

Drive amplifiers : Q1 on the APC UNIT, Q1 on the U-YGR UNIT

Reference voltage adjustment: R3 and Q4 on the U-YGR UNIT

UHF AMPLIFIER CIRCUIT

### 3-5 PLL CIRCUITS

#### 3-5-1 GENERAL DESCRIPTION

A PLL circuit provides stable oscillation of the transmit frequency and the receive LO frequency. The PLL circuit compares phases of the divided VCO frequency and reference frequency. The PLL output frequency is controlled from a crystal oscillator and the divided ratio (N-data) of a programmed divider.

#### 3-5-2 VHF VCO CIRCUIT (V-PLL UNIT)

The VCO circuit oscillates the PLL output frequency controlling a varactor diode.

The V-PLL UNIT separately has receiver VCO (Q2) and transmitter VCO (Q5) for wide range oscillation and clear oscillation respectively. Q1 switches the VCOs.

#### 3-5-3 UHF VCO CIRCUIT (U-VCO UNIT)

Q11 oscillates both the receive LO and transmit frequency. When receiving, IC1 (pin10) is grounded and turns D2 ON to shift the VCO oscillating frequency.

#### 3-5-4 PHASE DETECTOR CIRCUIT (V-PLL AND U-PLL UNITS)

The phase detector circuit detects the off phase components of the VCO frequency using a stable reference frequency.

Both IC1s on the V-PLL and U-PLL UNITS are the 500 MHz one-chip PLL ICs that contain a two-modulus prescaler, swallow counter, programmable divider and phase detector. The VCO oscillated signal is amplified at Q7 (VHF band; on the V-PLL UNIT) or Q1 (UHF band; on the U-PLL UNIT) and is then applied to the PLL IC (pin1).

In IC1, the entered signal is divided at a prescaler and programmable divider sections. A reference frequency is also divided at a divider section. Both of the divided signals are compared at a phase-detector section to output their differential signal.

### 3-5-5 LOOP FILTER (V-PLL AND U-PLL UNITS)

A loop filter converts the phase-detected signal (pulse signal) to DC voltage (PLL lock voltage) to control the VCO oscillating signal. The PLL lock voltage changes the reactance of a varactor diode in the VCO circuit. The DC voltage of the VHF PLL is also used for the receiver tuning circuit.

The phase-detected signal output from the PLL IC (pin 13) passes through the charge pump control (IC2) and is applied to the following loop filter:

For VHF PLL : Lag-lead-type loop filter (R2, R3, C5, C6)  
For UHF PLL : Active loop filter (Q4, Q5, R10~R12, C15~C17)

The charge pump control (IC2) cuts off the line of IC1 and the loop filter while in the circuit off condition of the power saver function.

The CPU indicates the 2nd IF signal level as the S-indicator (S-meter) to the LCD (DS1) when the SIN port (pin 2) is at "LOW."

The S-indicator signal coming from the DET UNIT is applied to the meter comparator (IC2, pin 3). Pin 2 of the meter comparator receives a counting signal from the CPU (pins 3-6). The counting signal is increased step by step.

The comparator (pin 1) is at "HIGH" when the counting signal is lower than the S-indicator signal and becomes "LOW" when the counting signal is higher than the S-indicator signal.

When the comparator (IC2, pin 1) becomes "LOW," the CPU detects that the signal strength level is the same as the counting signal level, and indicates the counting signal to the LCD.
