After its return, call all **:after** methods, least specific first.

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, ^{Fu}**call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, have generic function applied to *gen-arg** return with the values of (*c-type* {*primary-method gen-arg**}_M), leftmost *primary-method* being the most specific. In **defmethod**, primary methods are denoted by the *qualifier c-type*.

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body** with *ord-λ** bound to *c-arg** (cf. ^M**defgeneric**), with *symbol* bound to the generic function, with *method-combination-λ** bound to the arguments of the generic function, and with *groups* bound to lists of methods. An applicable method becomes a member of the leftmost *group* whose *predicate* or *qualifiers* match. Methods can be called via ^M**call-method**. Lambda lists (*ord-λ**) and (*method-combination-λ**) according to *ord-λ* on p. 17, the latter enhanced by an optional **&whole** argument.

(^Mcall-method $\left\{ \begin{array}{l} \widehat{method} \\ \text{(make-method } \widehat{form}) \end{array} \right\} [(\left\{ \widehat{next-method} \right\}^* \text{(make-method } \widehat{form}) \text{)}^*])$)

▷ From within an effective method form, call *method* with the arguments of the generic function and with information about its *next-methods*; return its values.

11 Conditions and Errors

▷ Define, as a subtype of *parent-types*, condition type *foo*. In a new condition, a *slot*'s value defaults to *form* unless set via *:initarg-name*; it is readable via (*reader i*) or (*accessor i*), and writable via (*writer i value*) or (**setf** (*accessor i*) *value*). With **:allocation** **:class**, *slot* is shared by all conditions of type *foo*. A condition is reported by *string* or by *report-function* of arguments condition and stream.

▷ Return new condition of *type*.

(^{Fu}signal ^{Fu}warn ^{Fu}error $\left\{ \begin{array}{l} \textit{condition} \\ \textit{type } \left\{ \textit{initarg-name value} \right\}^* \\ \textit{control arg}^* \end{array} \right\}$)

▷ Unless handled, signal as **condition**, **warning** or **error**, respectively, *condition* or a new condition of *type* or, with ^{Fu}**format** *control* and *args* (see p. 35), **simple-condition**, **simple-warning**, or **simple-error**, respectively. From ^{Fu}**signal** and ^{Fu}**warn**, return NIL.

(^{Fu}error *continue-control* $\left\{ \begin{array}{l} \textit{condition continue-arg}^* \\ \textit{type } \left\{ \textit{initarg-name value} \right\}^* \\ \textit{control arg}^* \end{array} \right\}$)

▷ Unless handled, signal as correctable **error** *condition* or a new condition of *type* or, with ^{Fu}**format** *control* and *args* (see p. 35), **simple-error**. In the debugger, use ^{Fu}**format** arguments *continue-control* and *continue-args* to tag the continue option. Return NIL.

▷ If *test*, which may depend on *places*, returns NIL, signal as correctable **error** *condition* or a new condition of *type* or, with ^{Fu}**format** *control* and *args* (see p. 35), **error**. When using the debugger's continue option, *places* can be altered before re-evaluation of *test*. Return NIL.

▷ If, on evaluation of *test*, a condition of *type* is signalled, evaluate matching *condition-forms* with *var* bound to the condition, and return their values. Without a condition, bind *ord-λs* to values of *test* and return values of forms or, without a **:no-error** clause, return values of test. See p. 17 for (*ord-λ**) .

If (*test-function condition*) returns T, *foo* is made visible under *condition*. For (*ord-λ**) see p. 17.

^M(**restart-bind** (({ $\widehat{\text{restart}}$
